Aim:

To compute LR(0) items for a given production.

Language Used:

Python

Algorithm:

1) Create a python file
2) Create a list to store the productions.
3) Following the rules for finding LR(0) items we store it in the array:
4) Print the following 2 arrays to output the leading and trailing of the given production.

   a)STEP 1: DRAW Transition diagram for SLR Parser

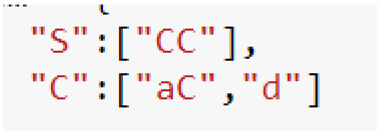
   b)STEP 2: Construct SLR Parsing Table

   (Note : Require FIRST and FOLLOW computation)

   c)STEP 3: Parse the given input string 'w'

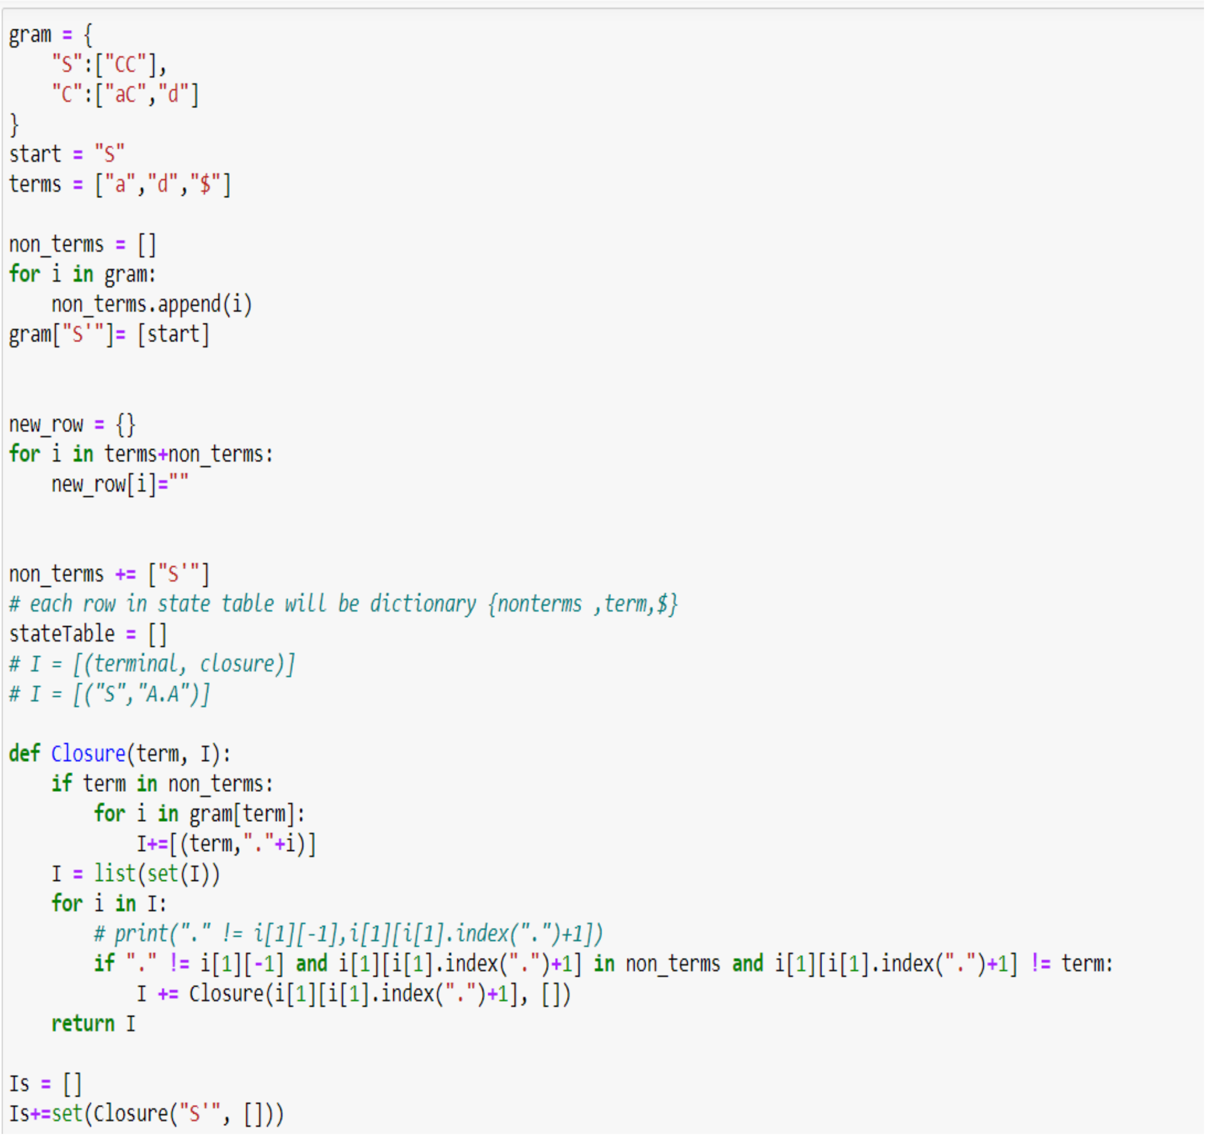
5) Print the go-to and action statements along with state-table.

Input string -



```
"S":["CC"],
"C":["aC","d"]
```

Code:



```python
gram = {
    "S":["CC"],
    "C":["aC","d"]
}
